

# IoT Device Fingerprinting on Commodity Switches

Carson Kuzniar, Miguel Neves, Vladimir Gurevich, Israat Haque

# IoT Landscape

- 12.3 billion connected IoT devices
- Roughly \$160 Billion in IoT enterprise spending
- IoT botnet-based DDoS attacks reaching over 1 Tbps
- Hundreds of thousands of compromised devices
  - Above 200K for Mirai botnet

# IoT Fingerprinting

Critical task for network administrators to

- Check for known vulnerabilities
- Set access/firewall rules
- Configure intrusion detection systems

# State of the Art

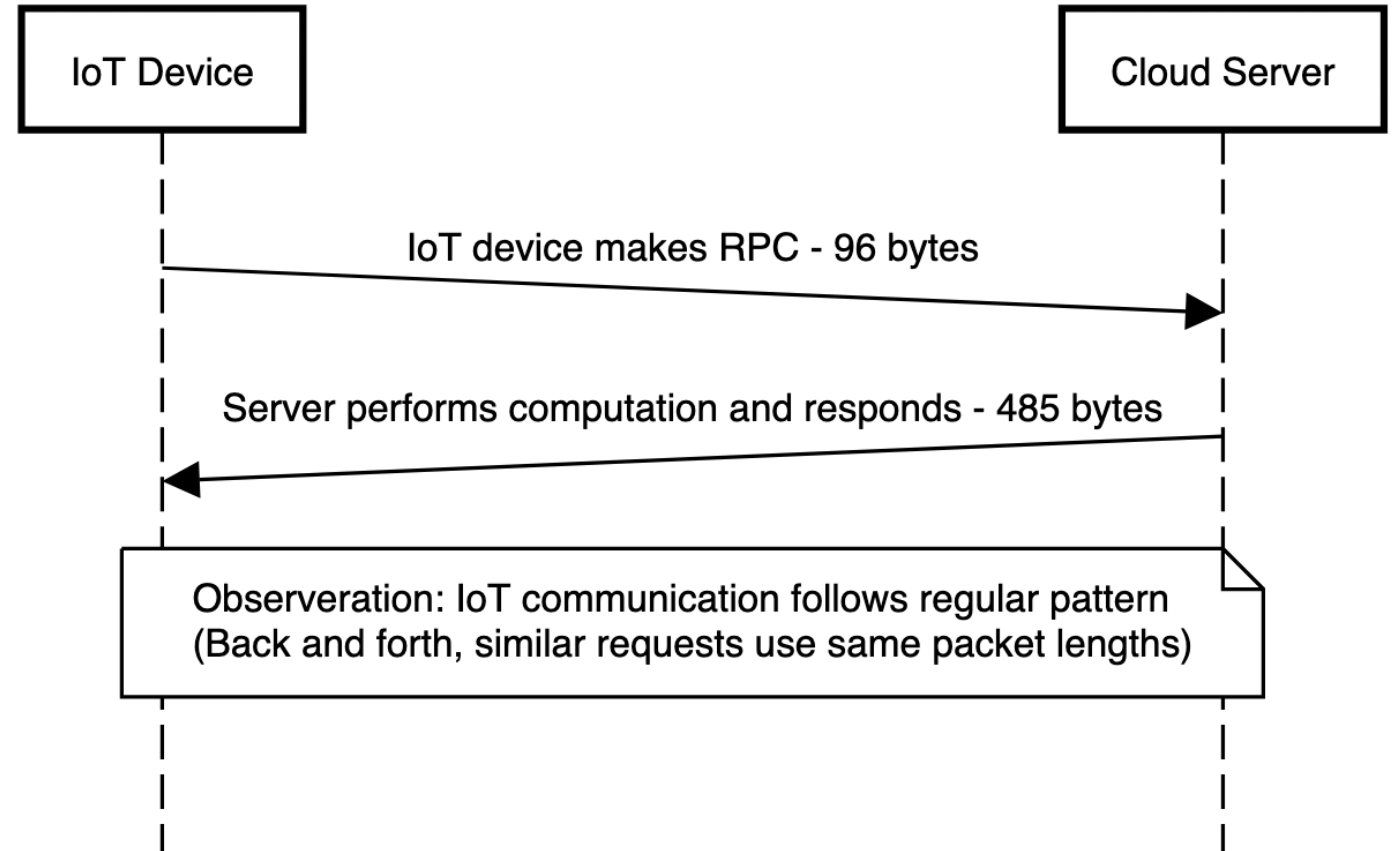

- Machine Learning (WiSec'20)
- Labeled Traffic from Manufacture/User (NOMS'20)
- Length and direction-based signatures (NDSS'20, IM'21)

Solutions face obstacles at scale or with network wide view  
Require mirroring traffic to dedicated hardware

# Device Signatures

- Use packet length and direction to create signatures for events (e.g., On/Off)
- Reliably fingerprint devices using these signatures

## IoT Device Communication

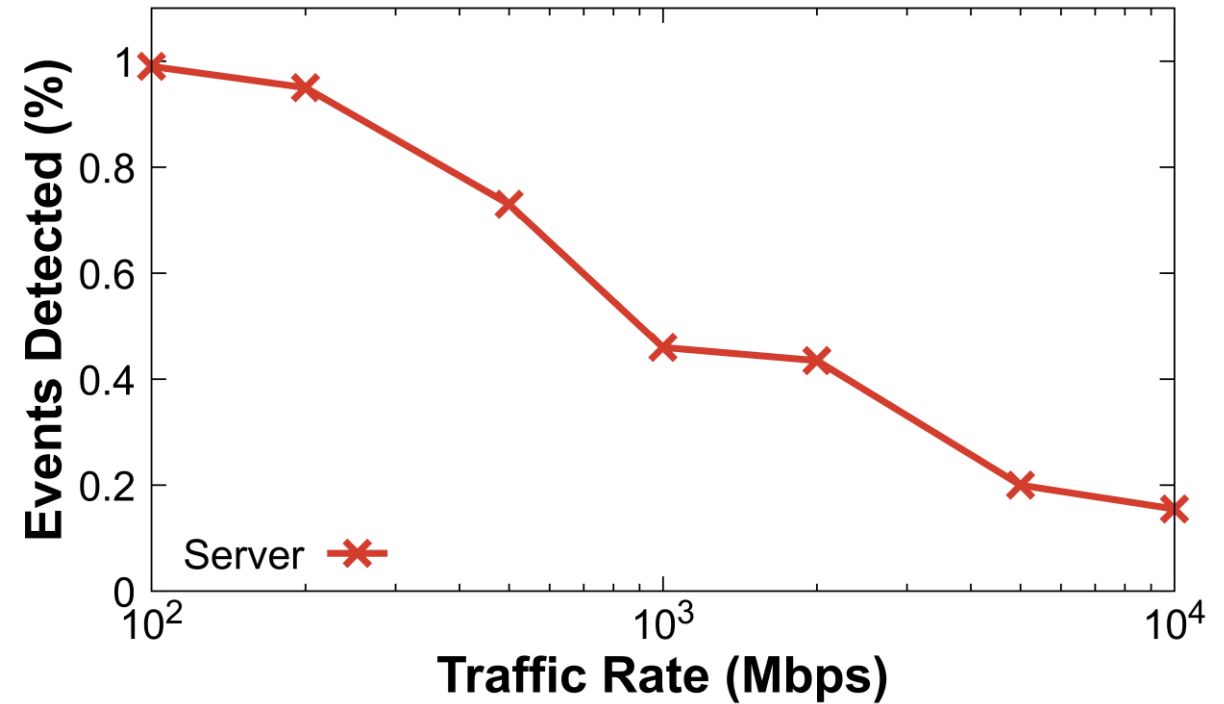

R. Trimananda, J. Varmarken, A. Markopoulou, and B. Demsky, "Packet-Level Signatures for Smart Home Devices," Proceedings of the 2020 Network and Distributed System Security (NDSS) Symposium, February 2020.

# Challenges

## Volume

- Large amounts of traffic on high-speed links
- Drop accuracy or add significant delay

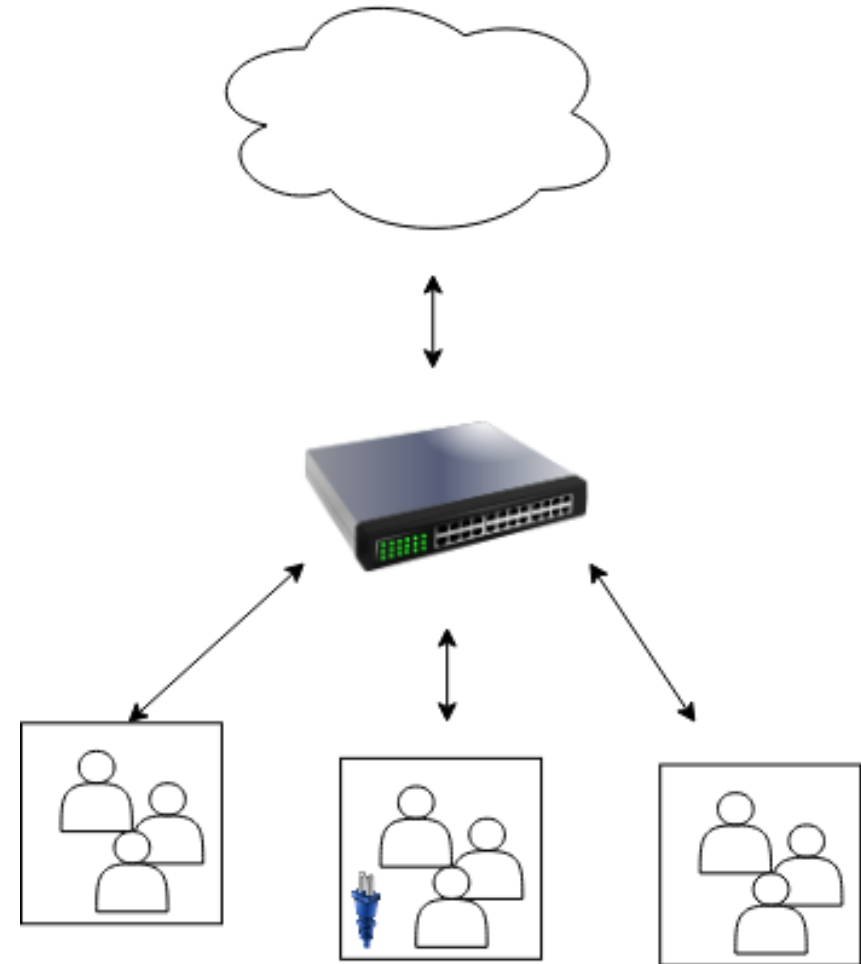

# Challenges

## Volume

- Large amounts of traffic on high-speed links
- Drop accuracy or add significant delay

## Granularity

- Sampling and aggregation miss quiet device

# Introducing PoirIoT

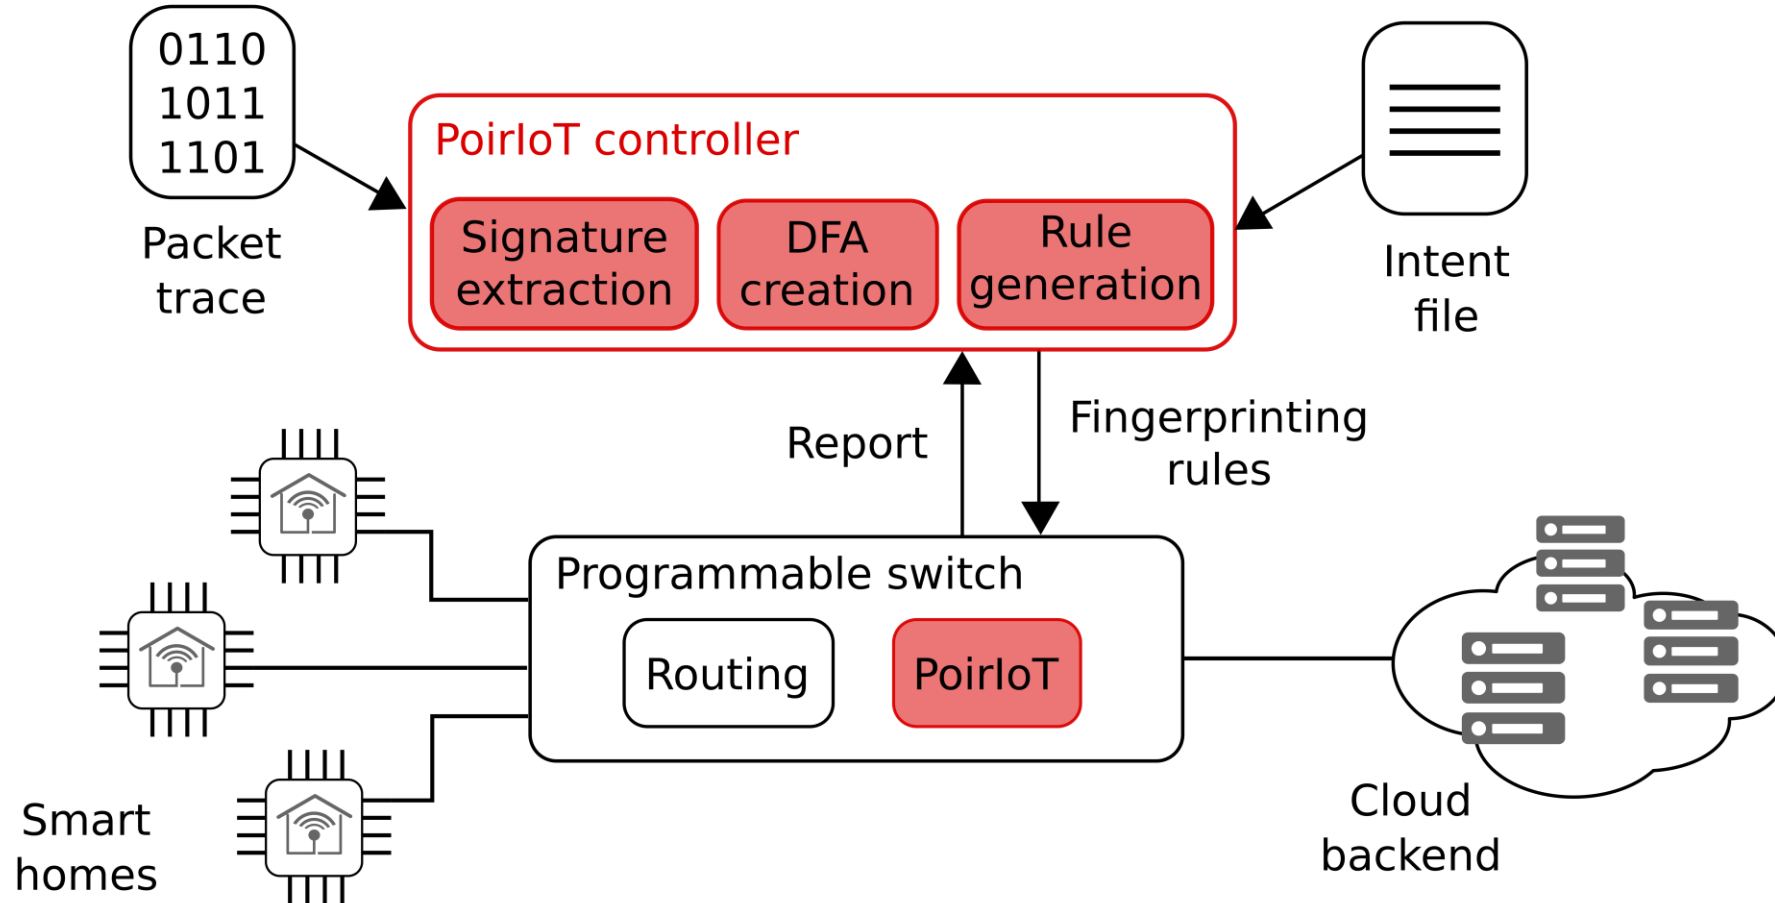

Programmable Data-Plane based Fingerprinting:

- High-speed : Tofino ASIC Line Rate (Tbps)
- High granularity: Inspects every packet as part of its forwarding process
- Modular : Efficient use of switch resources

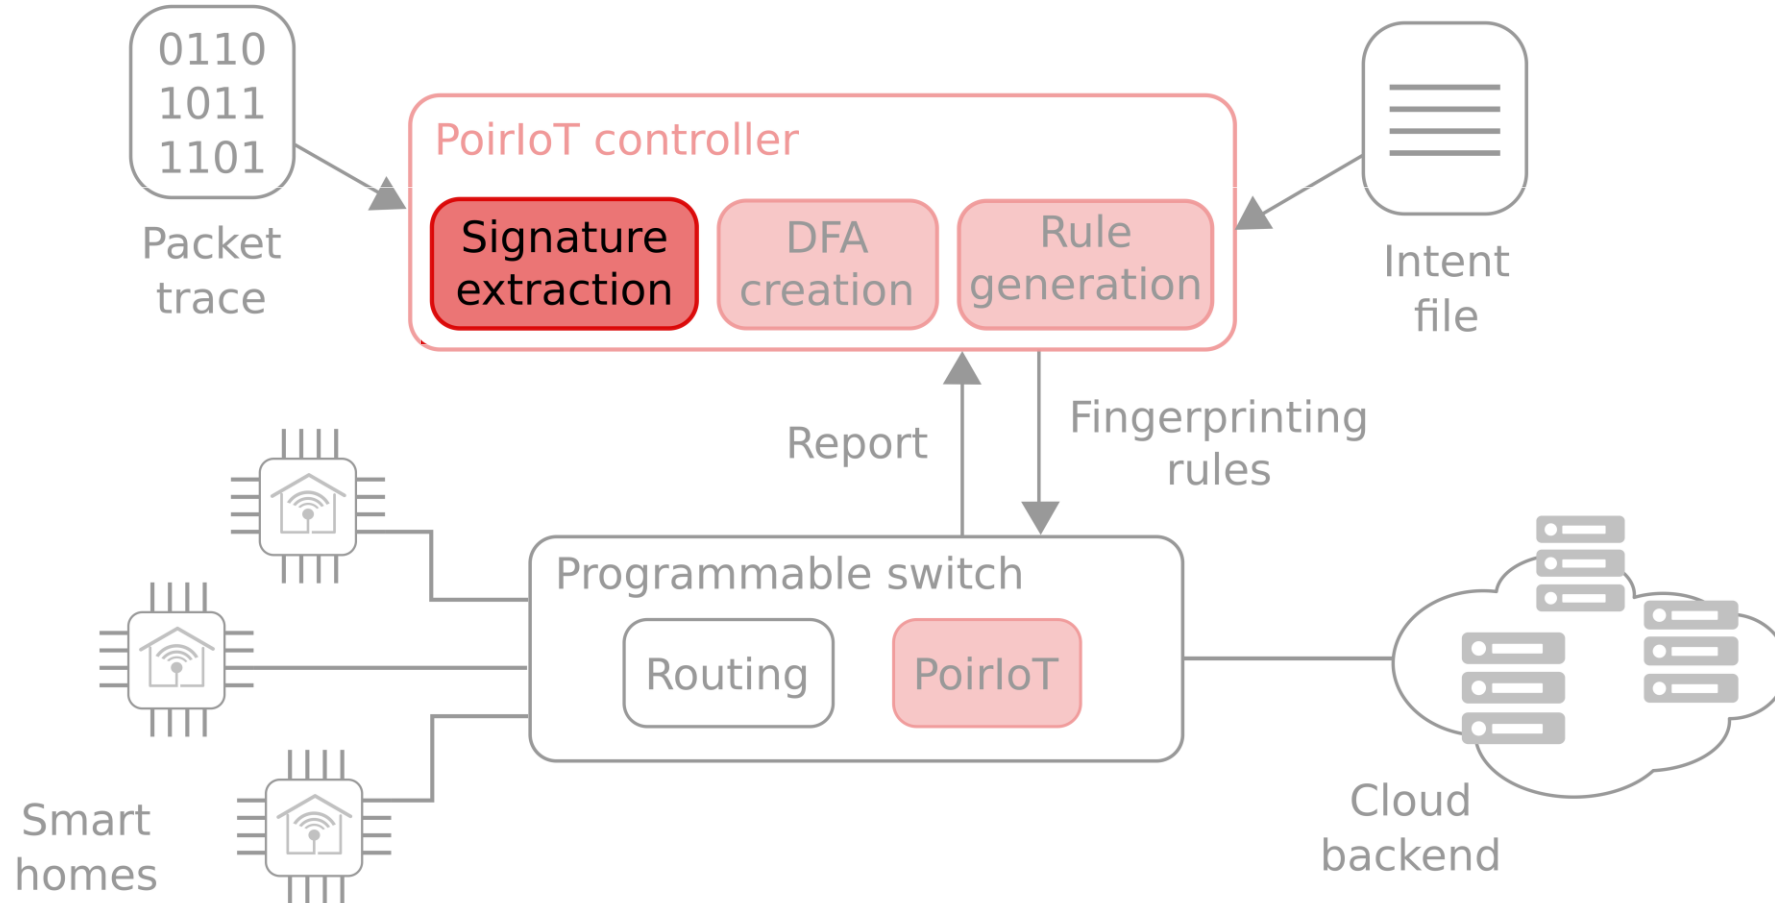

# PoirIoT Architecture

# PoirIoT Data Plane

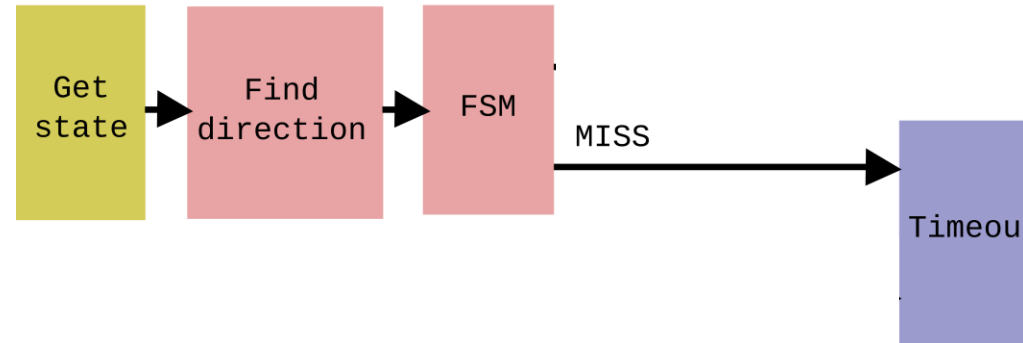

FSM

# PoiIoT Data Plane

- State and Timer info stored per flow
- Virtual FSM per flow while requiring only a single table

# PoiIoT Data Plane

- State and Timer info stored per flow
- Virtual FSM per flow while requiring only a single table

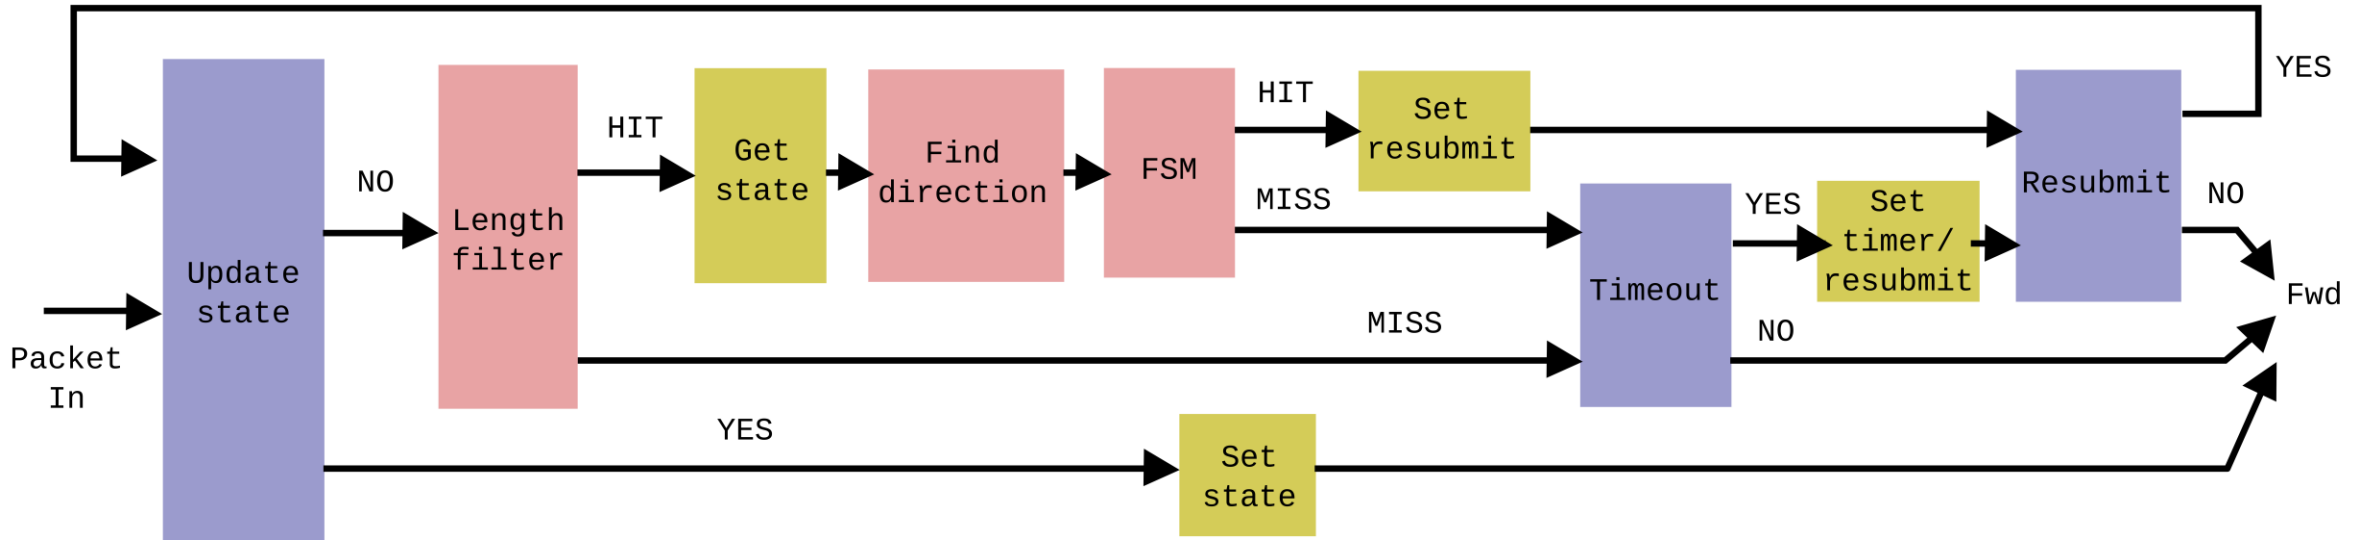

# PoirIoT Data Plane

- Length filter prevents resource allocation to flows with no packets of interest

# PoirIoT Data Plane

- Resubmit used instead of recirculation to update information without costs of engaging traffic manager

# Evaluation

PoirIoT implemented on Wedge 100BF-32X  
with Tofino ASIC

Code Available  
(<https://github.com/PINetDalhousie/poiriot>)

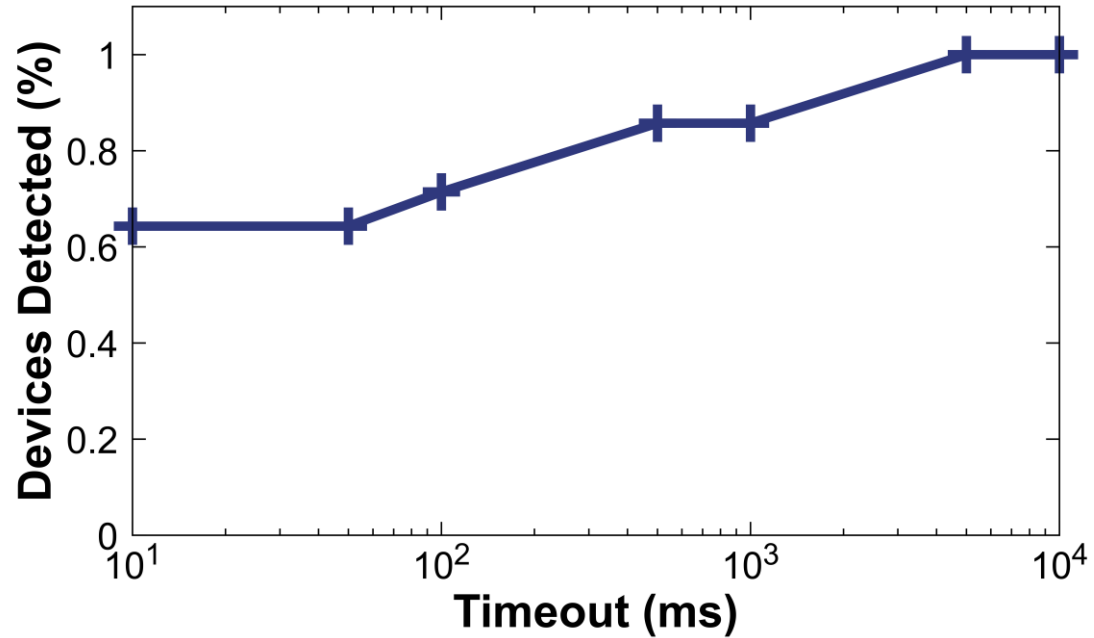

IoT traffic from publicly available dataset

- 14 devices
- ~30 Signatures

More results/details in Paper

# Device Detection

- Detect all 14 devices
- Timeouts needs to be sufficiently long to allow for RTT and longer signatures

# Device Detection

- Detect all 14 devices
- Timeouts needs to be sufficiently long to allow for RTT and longer signatures

# Device Detection

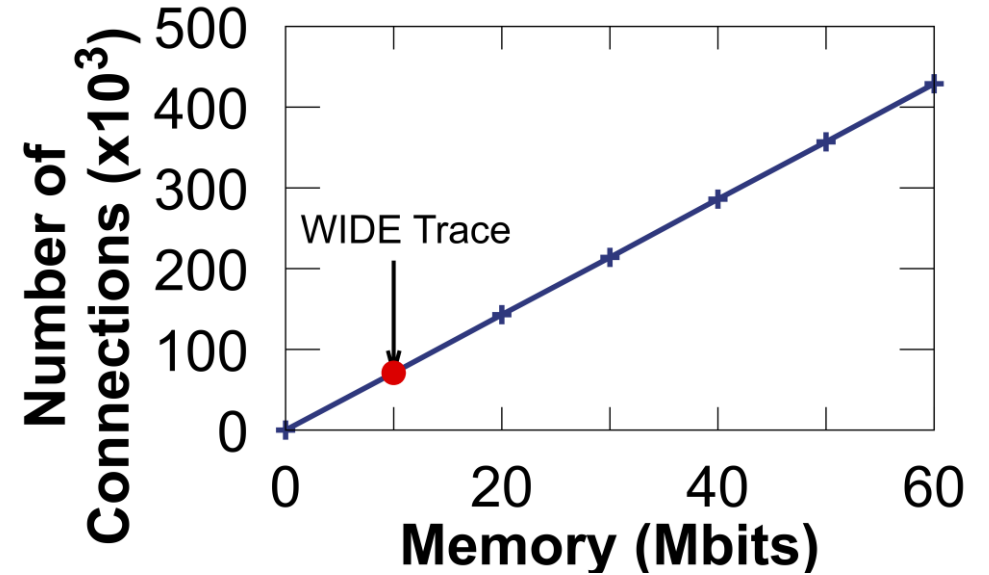

- Two types of synthetic signatures: uniformly sampled or derived from existing signature set
- Detection accuracy remains high (80%+) with hundreds of additional signatures

# Device Detection

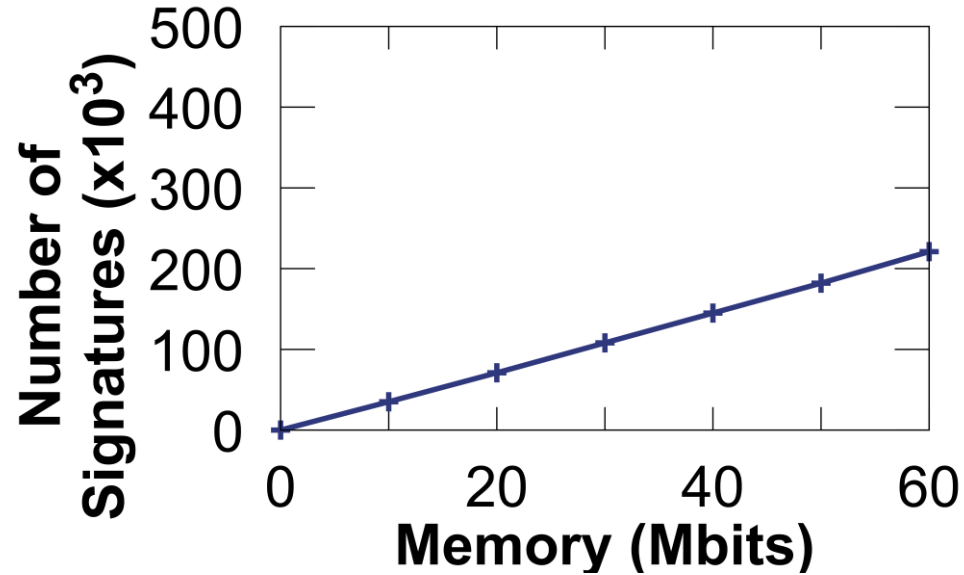

- Two types of synthetic signatures: uniformly sampled or derived from existing signature set
- Detection accuracy remains high (80%+) with hundreds of additional signatures

# Scalability

- Switch memory supports 200,000 signatures or 400,000 connections
- WIDE Trace shows flows that have a packet length matching one of our initial lengths

# Scalability

- Switch memory supports 200,000 signatures or 400,000 connections
- WIDE Trace shows flows that have a packet length matching one of our initial lengths

# Resource Consumption

Resource	Usage
Match Crossbar	3.1%
SRAM	5.1%
TCAM	0%
VLIW Instruction	3.4%
Hash Bits	4.7%

- Application takes minimal amounts of switch resources (No TCAM at all)
- SRAM most consumed resource (stateful information + table entries)

# Resource Consumption

Resource	Usage
Match Crossbar	3.1%
SRAM	5.1%
TCAM	0%
VLIW Instruction	3.4%
Hash Bits	4.7%

- Application takes minimal amounts of switch resources (No TCAM at all)

Hash Bits	4.7%

- Application takes minimal amounts of switch resources (No TCAM at all)
- SRAM most consumed resource (stateful information + table entries)

# Summary

- State of the art fingerprinting solutions face challenges (volume and granularity) at scale
- PoirloT brings fingerprinting to data plane offering:
  - High Speed
  - Packet level granularity
- System consists of two components controller + switch data plane
- Solution detects 100% of devices in a publicly available data set while using minimal switch resources

# Server Vs Switch

- Server drops packets at high rates and misses events
- Switch operates at line rate so no degradation as rates increase

# Event Detection

- Event accuracy starts to decrease at longer timeouts because of a lack of resets
- Event detection more granular so suffers more as signatures are added
